Direct Submission

Submitted (Ol-JUN-2002) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  19304: contig of 19304 bp in length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This record contains 88 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Web site: http://www-seq.wi.mit.edu

arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved. 982: contig of 882 bp in length 1986: contig of 904 bp in length 1986: contig of 904 bp in length 1986: contig of 904 bp in length 3005: gap of 100 bp 2905: contig of 919 bp in length 4003: gap of 100 bp 5022; contig of 922 bp in length 6024: gap of 100 bp p in length 6020: contig of 912 bp in length 6020: contig of 914 bp in length 6020: contig of 914 bp in length 6020: contig of 914 bp in length 6020: gap of 100 bp p in length 6020: contig of 914 bp in length 6020: contig of 910 bp in length 6020: contig of 910 bp in length 6020: contig of 910 bp in length 6020: contig of 902 bp in length 6020: contig of 902 bp in length 6020: gap of 100 bp p in length 6020: contig of 909 bp in length 6020: contig of 909 bp in length 6000: contig of 900 bp in length 6000: con 1: gap of 100 bp 1: contig of 910 bp in length 1: gap of 100 bp 1: contig of 897 bp in length 1: gap of 100 bp o: gap of 100 bp 1: contig of 893 bp in length 1: gap of 100 bp 1: contig of 918 bp in length 2: gap of 100 bp in length , o bp of 915 bp iv 100 bp contig gap of 10908: 11008: 11921: 14949: 15049: 26100: 27013: 33064: 33164: 13947: 12021: 12931: 13031: 14047: 5960: .0909 6971: 7996: 18096: 8986: 19086: 20958: 21948: 22048: 23057: 23967: 24067: 25001: 25101: 26000: 27113: 28031: 29041: 29141: 30038: 31031; 32049: 32149: 18987 19983 20093 20093 21059 21059 21049 22049 22958 23958 24068 25002 25102 28132 29142 30039 30139 31032 26001 26101 27014 28032 31132 32050 32150 33065

sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-789A18, 2000 bp overlap,
the clone sequenced to the right is RP11-515K12, 2000 bp overlap.
Actual start of this clone is at base position 146042 of
RP11-789A18; actual end is at base position 23686 of RP11-515K12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A transposon was identified in a growth of the clone RP11-638D14, which is not a part of the submitted sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                          This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A transposon was identified in the finished region of this clone and removed prior to submission. The transposon would insert after base pair 83916 of this sequence.
                                                                                                                                                                                                                                                                                                            NOTICE: This sequence may not represent the entire insert of this
                                                                                                                                                                                                                                                                                                                            clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence from base 156374 to base 156453 was derived from one plasmid subclone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence from base 156479 to base 156499 was derived from one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphisms have been identified between AC069314, AC010138 and

Submitted (09-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 9, 2003 this sequence version replaced gi:24818376.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ms to the setimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.

Where differences are found these are annotated as variations together with a note of the overlapping clone ame. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em.; EMBL; Sw.; SWISSPROT; Tr.; TREMBL; Wp.; WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep Clone-derived zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats. clone sections once, or longer because we provide a small overlap between neighboring data submissions.
```

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu MAPPING INFORMATION: restriction digest.

SOURCE INFORMATION:
The RECI-23 BAC Library has been constructed by Kazutoyo Osegawa
and Minako Tateno in the laboratory of Pieter de Jong
(http://www.chori.org) from female C57BL/6J mouse kidney and/or
brain genomic DNA. The clone and detailed information can be
obtained from Research Genetics, Inc. (http://www.resgen.com) or
Pieter de Jong and coworkers at http://www.chori.org

NEIGHBORING SEQUENCE INFORMATION:
This sequence is the entire insert of the clone.

No Plaza, Houston, TX 77030, USA

On Sep 14, 2002 this sequence version replaced gi:22450321.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequening reads assembled using Atlas (http://www.hgst.bcm.tmc.edu/projects/fart/). As a reault, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature table.

Contigs will be indicated in the feature table.

* NOTE: This is a "working draft' sequence. It currently a consists of 2 contigs. The true order of the pieces in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 217012: contig of 217012 bp in length 217013 217112: gap of unknown length 217113 218328: contig of 1216 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Web site: http://www.hgsc.bcm.tmc.edu/

SOURCE INFORMATION:

The RPCI-23 BAC Library has been constructed by Kazutoyo Osegawa and Minako Tateno in the laboratory of Pieter de Jong (http://www.chori.org) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Geneics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                          NEIGHBORING SEQUENCE INFORMATION:
This sequence is the entire insert of the clone. This clone is overlapped by ACI10175 and ACI24414.

Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (15-MAY-2004) Genome Sequencing Center, 4444 Forest Park Parkway, St. Louis, MO 63108, USA OM May 12, 2004 this Sequence version replaced gi:28973968.

                                                                                                                                                                                                                                                                                                                                                                                     REFERENCE
                                                                                    Submitted (199 MAX-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On May 9, 2003 this sequence version replaced gi:22771587.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence conly contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* Consists of I contigs. Gaps between the contigs

* are represented as runs of N. The order of the pieces

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* I 227929: contig of 227929 bp in length.

Direct Submission

Submitted (09-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza. Houston, TX 77030, USA
ON NOV 9, 2002 this sequence version replaced gi:23321591.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.ed/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assembly program: Phrap; version 0.990329

It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Each contig described in the feature table below represents a scaffold in the Atlas ssembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence conly contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          40609: contig of 40609 bp in length
40709: gap of unknown length
281950: contig of 241241 bp in length
283370: contig of 1320 bp in length

If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Peatures listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annotation.ht
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found
of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA 5 (bases 1 to 146945) Worley, K.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3507. ..3632

It currently consists of 18 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented arbitrary but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Contacts sequence submissions@genome.wi.mit.edu

A fusion receptor composition having the structure:prostate-specific membrane antigen-single chain variable fragment:optional connector:cytoplasmic domain, useful for treatment of cancer.

Example 6; Page 15; 25pp; English

The invention relates to a novel fusion receptor composition having the structure: PSMA (prostate-specific membrane antigen)-scFv (single chain variable fragment):optional connector:cytoplasmic domain, where the fusion receptor is effective when expressed in a T-cell to promote a cellular immune response to PSMA. The PSMA-scFv is a single-chain antibody cloned from the V region genes of a hybridoma specific for PSMA, such as J591. The optional connector is provided to give a spacing

```
substantial function. The cytoplasmic domain, such that both retain substantial function. The cytoplasmic domain directs the function of the cusion receptor and is generally the cytoplasmic domain of a molecule which functions as a transducer of a mammalian immune response in the presence of an WHC (major histocompatibility complex)-peptide complex or costimulatory factor. Examples of cytoplasmic domains that may be employed in the present invention include the T-cell receptor gamma-chain cytoplasmic domain and the CD28 cytoplasmic domain. In a method of the invention, an expression vector encoding the fusion receptor is transduced into primary T-lymphocytes obtained from the patient to be treated. The transduced lymphocytes are returned to the patient to be treated. The transduced lymphocytes are returned to the patient to PSWA-colls. The fusion receptor function cytoplasmic and proliferate in response to PSWA-cells. The fusion receptor promotes a cellular immune response to PSWA and can thus be used to target PSWA-positive tumour cells. The treatment of prostate cancer and other cancers that express PSWA. New fusion protein, useful for inducing host immune response, comprises variable region of light chain of an antibody linked to variable region of antibody, CD28 receptor signaling domain and transmembrane domain.

Example 3; Page 4; 9pp; English.

The present sequence is that of an upstream primer, used with the

downstream primer given in ABA92025, in the PCR amplification of a segment of human T cell surface receptor CD28 cDNA. The amplified segment encodes part of the extracellular domain of CD28, and the transmembrane and the cytoplasmic domains. Plasmid phosCD28 was used as template. The 5 primer contains a Bamid site, and these sites in the PCR product were used to facilitate insertion into retroviral vector SFG. A cell-surface molecule capable of CD28 signalling in T cells interacting with disialoganglioside GD2 tumours was signalling constructed. This comprised the antigen-binding site of a GD2-specific antibody and the transmembrane and signalling domains of the CD28 molecule. This is an example of fusion proteins of the invention comprising such fusion proteins exhibit enhanced survival when reintroduced to an in vivo environment. They can be used to induce an immune response to cells, particularly tumour cells which express the anti-GD2 sefv are useful for treatment and anti-GD2 sefv are useful for treatment of melanomas, and head to manned anti-GD2 sefv are useful for treatment of melanomas, and head to manned anti-GD2 sefv are useful for treatment of melanomas. neuroblastomas, small lung carcinoma, sarcomas and brain tumours that express GD2 as a surface antigen. Cells expressing the fusion proteins of the invention can also be used for in vitro purging of stem cells or bone marrow and for in vivo targeting of tumour cells and other antigenbearing cells for imaging

New nucleic acid polymer encoding a chimeric T cell receptor having a zeta chain portion, useful for treating disorders where the immune response needs to be induced, such as cancer.

Example 7; SEQ ID NO 6; 25pp; English.

The invention relates to a nucleic acid polymer encoding a chimeric T cell receptor (TCR) which comprises human CD3 zete chain intracellular domain, a co-stimulatory signalling region and a binding element that specifically interacts with a selected target. The methods and

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to crecombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising comprising cancer acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a blochip comprising CA nucleic acid or CA nucleic acid. The sequences of the invention were identified using concogenic retroviruses, which insert into the genome of the host organism or random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or carcinoma (especially breast cancer, prostate cancer, lymphoma or carcinoma fespecially breast cancer, prostate cancer, lymphoma or carcinoma cards, proteins and antibodies are also useful as therefore agents and in screening and evaluating drug candidates. The present sequence represents a specifically claimed human CA nucleic acid present sequence of the printed specifically claimed human CA nucleic acid consequence of the invention. Note: The complete sequence data for this sequence of the invention. Note: The complete sequence data for this cancer and an according and evaluating drug candidates. The printed specification, but was obtained in alectronic format directly from MIPO at the printed specification, but was obtained consequence.
                                                                                                                                                           Human, carcinoma associated; oncogene; carcinoma; cancer; breast;

The invention relates to new recombinant nucleic acids. The invention also relates to a host cell comprising a recombinant nucleic acid or expression vector comprising a recombinant nucleic acid, a recombinant protein, a method of screening for drug candidates, a cid, a recombinant protein,
                                                                                      New recombinant nucleic acid comprising a nucleotide sequence of any of
the carcinoma-associated (CA) genes, useful for screening for drug
candidates for diagnosing or treating carcinomas.
                                                                                                                                                                             The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinoma-associated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rcinoma associated nucleic acid; CA nucleic acid; gene; de associated protein; CAP; carcinoma; leukaemia; lymphoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New carcinoma associated gene or protein, useful for preparing a composition for diagnosing or treating carcinoma e.g., leukemia or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polymucleotide of the invention has oytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and

Soluble proteins binding to B7 proteins and block antigen presenting cells - are useful in treating T-cell mediated immunosuppression diseases e.g. transplant rejection, auto immune diseases etc.
                                                                                                                                                                                                                                                                                                                                                                                       The CDNA sequence in AAQ28837 is derived from Aruffo A and Seed B, PNAS USA 84, 8573-77, 1987. The CD28 CDNA encodes a protein of 220 AAB (AAR27103). It contains a signal peptide from AAB 1-18 which is cleaved during the maturation of CD28 protein. The transmembrane region is AAB 153-79. For the production of soluble CD28 protein, the transmembrane region is CD28 protein to the protein is AAB region is deleted. The CD28 protein derived from P9-MIT comprises residues 19-157 and is not soluble. The CD28 protein derived from p9-CIT comprises residues 19-151 and is soluble. MIT and CIT are primers. Typiner is used as the 5' primer to pair with any 3' primer, eg. MIT and CIT, in a PCR reaction for the procurement of trucated CD28 gene which would direct the production of soluble CD28 protein. DNA encoding AAB 19-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              151 of CD28 is claimed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
carcinoma associated protein (CAP) encoded by a nucleotide sequence, a method of screening for a bioactive agent capable of modulating the activity of a CAP, a method of evaluating the effect of a candidate carcinoma drug, a method of diagnosing carcinoma, a method for inhibiting the activity of a CAP, a method of treating carcinoma, a method for inhibiting the activity of a CAP, a method of treating carcinoma, a method of neutralising the effect of a CAP and a method of diagnosing carcinoma or propensity to carcinoma. A method of evaluating the effect of a candidate carcinoma drug comprises administering the drug to a patient, removing a corcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the expression of a gene comprising the nucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of more ganes comprising the nucleotide sequence in a first individual and comparing the expression of the gene from a second normal tissue type from the first individual or a second capacity of a CAP comprises from the first individual nor a second the first individual has carcinoma. A method of inhibiting the activity of a CAP comprises contracting an agent specific of or the CAP. The polypeptide specifically binds to the protein encoded by the nucleic acid. The polypeptide specifically binds to the protein encoded by the nucleic acid. The nucleic acid. The comprises an antibody that specifically binds to the protein encoded by the nucleic acid. The nucleic acide are useful for proparing a composition for diagnosing or treating carcinoma e.g., brotein encoded by the nucleic acide the printed specification but was associated (CA) nucleic acide of the invention. Note: The sequence data for this patent did not form part of the printed specification but was formed in electronic format directly from USPDO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Antisense or triplex forming oligonucleotides which target sites within the present sequence, the CD28 cDNA, reduce T cell CD28 gene expression, useful in the treatment of CD28 mediated diseases, particularly immune system disorders, e.g. graft versus host diseases, septic shock, viral disease, psoriasis, type I diabetes mellitus, thyroiditis, sarcoides, multiple sclerosis, uveitis, rheumatoid arthritis, systemic lupus erythematosus, inflammatory bowel disease, etc. Reducing CD28 expression may reduce the effects of antigenic stimulation of CD28 positive T cells, with a consequent reduction in cytokine release.                                                                                                                                                                          A library of recombinants having inserts greater than 0.8kb in size was prepared in the piH3M vector (see AAQ21166) from 1 microgram of polyA (plus) RNA isolated from the human lymphoblastoid cell line JY. The library was screened from the buman lymphoblastoid cell line JY. The antibody enrichment method (see e.g. AAQ21164 or AAQ21165). After the third transfection, COS cells were panned with a specific anti-CD28 Ab. A Hirt supernatant was generated and transfected into E.coli. DNA was prepared from the resulting colonies and transfected into COS cells. Surface expression of CD28 antigen was detected in 3 of the 8 transfected cultures by indirect immunofluorescence. The CDNA insert from one of the positive clones was sequenced. (Updated on 25-MAR-2003 to correct PA

cDNAs from mammalian expression libraries. The method is based on transient expression of an antigen in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for the isolation and molecular cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see AAV63442-63) encoding cell surface antigens associated with mammallan lymphocytes such as CD1-53, ICAM, LFA-3, FCRIA, FCRID, TLisA and Leu8 (see AAW80440-55). CD28 polypeptide (see AAW80442) has been expressed in transfected COS cells. The purified genes and proteins are useful for immunodiagnostic and immunotherapeutic applications, including the diagnostis and treatment of immune-mediated infections, diseases, and clasorders of animals, including humans. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cDNA encoding human CD40 antigen - useful for cloning cDNA encoding cell surface antigens, constructing cDNA libraries, expressing vectors for expression in eukaryotic cells or their fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cell surface antigen; human; T cell antigen; T lymphocyte;
